

Flavor Index — Video Editing Script

This builds directly on the hero video shot list — same footage, same voiceover — but broken down to exact edit points, sound cues, and on-screen text timing so you can cut it in CapCut without guessing.

Total runtime target: 26-28 seconds.

TRACK LAYOUT (how to organize your CapCut project)

Video track (bottom): your screen recordings, in order

Text/overlay track: on-screen text cards

Voiceover track: your recorded narration (record this first, cut video to match it — not the other way around)

Music track: low-volume instrumental bed

SFX track: small interaction sounds (see below)

SHOT-BY-SHOT EDIT SCRIPT

[0:00–0:03] Hook

Footage: Notes app screen recording, typing "why do I always default to the same 3 flavor combos"

Voiceover: "So many cooks and bakers stick to the same handful of flavor combos out of habit."

Edit notes: Let the typing visually finish right as this VO line ends — trim the recording so the last word lands within ~0.2s of the VO's last syllable. If your typing footage runs long, speed it up slightly (110-120%) rather than cutting it short mid-word.

Sound: Soft keyboard-tap SFX under the typing (CapCut's built-in "Typing" sound effect works well), fade out music starts here at low volume (~15-20%)

Transition out: Hard cut, no fancy wipe — hard cuts read as more authentic/less "produced" for this style

[0:03–0:07] Supporting line — branded text card

Footage: Static or very slightly animated text card, styled like the app itself (charcoal `#201C1B` background, saffron gold `#D9A441` text, same border/card treatment as the app's overlay cards)

On-screen text: "There's a real logic behind pairing flavors." — fade in + slight upward slide (0.3s), hold, fade out

Voiceover: "There's actually a real logic to which flavors pair well — most people just don't have it memorized."

Edit notes: Keep the card on screen for the full VO line, don't let text and voiceover finish at different times — mismatched timing is the #1 thing that makes overlay text feel sloppy

Sound: No SFX here, just music continuing underneath

Transition out: Quick cross-fade (0.15-0.2s) into the live app footage — this is the moment you're moving from "concept" to "product," a soft transition signals that shift better than a hard cut

[0:07–0:24] Main demo (the core of the video — spend your best footage here)

Break this into 4 internal beats rather than one long unbroken clip, even though it's one continuous screen recording underneath — cut between different zoom levels/crops of the same footage to keep visual energy up:

Beat A (0:07–0:11): Category selector

Tap through Sweet → Savory → Both

VO (starts here): "So I built a tool that does it for you."

SFX: a light "tap" click sound on each button press (CapCut "UI Click" or similar)

Beat B (0:11–0:16): First shuffles

Press shuffle 2-3 times, letting the card-flip animation play each time

VO continues: "Pick sweet, savory, or both — shuffle,"

SFX: a subtle "whoosh" or card-flip sound synced to each flip (check CapCut's sound library for "swipe" or "card flip")

Edit notes: if your real shuffles feel slow/dead air between taps, speed this segment up 120-130% — the energy should feel snappy, not like you're waiting on the app

Beat C (0:16–0:20): Lock + reshuffle

Zoom/crop in slightly tighter on the card as you click the lock icon (a subtle punch-in, not a jump cut, works well here — CapCut's "zoom" keyframe on the clip)

Shuffle again, showing the locked card stays while others change

VO continues: "lock what you like, and it keeps suggesting flavors that actually work."

SFX: a distinct "lock click" sound (slightly different from the tap sound in Beat A, so it reads as a meaningfully different action) on the lock icon press

Beat D (0:20–0:24): Save

Click "Save Combo," quick cut to the Saved Combos list populating

No new VO here — let the visual breathe for a beat, this is a natural micro-pause before the CTA

SFX: a soft "confirm" chime, subtle, not celebratory/game-like

[0:24–0:28] End card

Footage: Hold on the app (Saved Combos list visible), with text overlay "Free to use — link in bio" using the same branded card style as the [0:03-0:07] segment for visual consistency

Voiceover: "Free to use — link in bio."

Edit notes: Hold this frame for the FULL 2+ seconds after VO ends before the video loops — don't cut away the instant the voiceover finishes, give people a beat to actually read it

Music: fade out over the last 1 second

MUSIC SELECTION GUIDANCE

Look for something in CapCut’s free library tagged “warm,” “acoustic,” or “lo-fi” — avoid anything with a hard drop or big builds, since this video doesn’t have a “moment” to build toward, it’s steady and explanatory. A soft, mid-tempo instrumental with light percussion works better than anything melodic/vocal (vocals compete with your voiceover).

CAPTION STYLING

Auto-generate captions from your voiceover track in CapCut, then manually restyle them to match your brand instead of using a default template:

Font: a clean bold sans-serif (CapCut has several “Sans” options that work)

Color: warm chalk white (`#F2EDE4`) text, no background box — or if you want a background for legibility, use the same charcoal (`#201C1B`) at ~80% opacity, not CapCut’s default black/yellow karaoke style

Position: lower-third, but not so low it gets cut off on different aspect ratios between IG/YouTube — leave at least 12% margin from the bottom edge

TWO EDIT-STYLE OPTIONS

Option A — Minimal (recommended, matches your brand): hard cuts, no zoom effects except the one subtle punch-in noted in Beat C, quiet SFX, restrained captions. This matches the “kitchen label” design system’s overall restraint.

Option B — Punchier: if minimal feels too flat once you see a rough cut, add a slight zoom-in (105-110%) on every new shot rather than just Beat C, and speed up Beats A/B another 10%. Don’t do both A’s restraint AND B’s energy at once — pick one direction and stay consistent for the full video, mixing them is what makes edits feel unintentional rather than stylized.

BEFORE YOU EXPORT

Watch it once fully muted — if you can still follow what’s happening from captions and visuals alone, the pacing is solid. If a section feels confusing without sound, that section needs either more time on screen or a clearer visual moment (most people scroll with sound off for the first watch).
